Internet Connectivity

High-speed Internet access for your business

Keep your business connected with high-speed Internet connectivity service options from Working Technologies that provide a critical avenue for connecting with customers and suppliers, and accessing real-time applications over the Internet.

We can offer cost-effective Internet service in various types and speeds. You'll receive connectivity that can:

- Support your applications
- Extend the reach of your VPN
- Connect telecommuters to your main office
- Provide remote access to your WAN environment
- Quickly transfer large amounts of data
- Support global connectivity

Local Fibre Access

Fibre Access provides a high speed, uncontended and reliable connection that your business can rely on for speed and guaranteed service levels. Fibre Access is a next generation Internet access service.

Who would benefit from Fibre Access?

Fibre Access is for those businesses whose access to the Internet is critical, and where availability is key.

How can it benefit my business?

The cost of having fibre laid directly to the premises has hindered some smaller companies who really need the reliability of an uncontended service in the past. Fibre to the local cabinet and delivery by the existing cabling into your office makes fast, uncontended and reliable data connections an option for everyone.

Fibre broadband

Fibre broadband (sometimes called 'FTTC' or 'fibre to the cabinet') is a next-generation broadband product that offers much faster speeds than traditional broadband. Using fibre optic cables that run from the exchange to local street cabinets, Fibre broadband is available to both home and business users.

What products are available?

Working Technologies offer two product sets:

- Fibre broadband with speeds of up to 76Mbps download and up to 19 Mbps upload, with no download limits
- Fibre broadband with traffic prioritisation, speeds of up to 76Mbps download and up to 19Mbps upload, with no download limits For all 24 month contracts, we will provide a pre-configured Thomson Technicolour router free of charge, with the option to upgrade if required.

Leased Lines

When a simple ADSL is not sufficient for your business requirements, leased lines come into play. This is referred to as Direct Internet Access with guaranteed speeds for both way communications. In todays modern communications world it is not enough to just have a good download speed, information needs to be carried both ways.

Leased lines can also offer much improved Service Level Agreements over ADSL or Indirect circuits. Could your business be off the Internet for days at a time? Leased lines, or Direct Internet Access circuits offer service level agreements with resolutions times within hours rather than just an acknowledgement of the problems taking days as with ADSL circuits.

Working Technologies will work with you to find the best solution for your Internet access, at the best price.
